

## News Update

June, 2010

We are pleased to announce improved data collection around pulmonary function for member hospitals. All hospitals will be able to compare productivity on 21 separate CPT-based procedure groups. These groups were selected by our member hospitals as those most impacting workload and include Spirometry, Bronchiodilation Responsiveness and Stress Tests. With the full suite of tools, pulmonary function activities can be compared to a host of outcomes such as asthma returns and length of stay. Additionally hospitals can look at detailed information on how each other's respiratory departments are staffed and run to make finding best practices simpler.
